

Mobile Router Center

This rolling router center has onboard storage for all your router components, folds into a tidy package, serves as an extra work surface and rolls out of the way when you're done!

Use It!

Move It!

Store It!

Unfold It!

Organize It!

A router table is one of the most versatile tools you can add to any shop. Whether you're making doors or moldings, router tables are do-it-all tools. This shop-made unit is a fully featured router table with portability, versatility and compactness. It's perfect for any shop in which floor space is precious. The top has as much real estate as a full-size router table but, like a benchtop unit, the router center can easily be stowed when you're done. The key to a flat, rigid table is the torsion-box design. A torsion box is nothing more than a crisscross frame captured in a top and bottom. It's easy to build, dead flat and solid as a rock.

Build the top

- Crosscut both sheets of plywood required for this project into 32" long slabs (see the plywood cutting diagram, below).
- Cut to size the ribs (A and B, Fig. A, below), ends (C) and top and bottom skins (D). Cut the hardboard top (E) 1" larger than the top skin.
- Glue and screw the torsion-box ribs together (Photo 1). Pin the top and bottom skins to the torsion box (Photo 2). Assemble the torsion box on your tablesaw (Photo 3).
- After the glue is dry, rough out the cavity in the bottom of the torsion box and trim it flush with a router (Photo 4). Use a 1/4" round-over bit to ease the sharp corners. Flip the torsion box and flush-trim the hardboard top to match the box's top skin (D).

Build the case

- Assemble the case ribs (H, J).
- Glue and screw the case skins (K) to the ribs (Photo 5).
- Rough-out and flush-trim the router cavity on the inside of the case. Use a 1/4" round-over bit to ease the corners.
- Screw and glue the top (L) and bottom (M) to the case. Attach one layer first. Then add the second piece of plywood by screwing from below so no screws show on the top side of the double panels.
- Cut the door panels (N) to size.

Add edge banding

- Make all the edge banding 1/32" oversize in width. After you glue it on, sand it flush to the plywood.
- Make the banding for the case and door (O), the double-thickness top and bottom (P) and the torsion-box top (F, G).
- Cut, fit and glue the narrow banding to the remaining edges of the case and the doors and the wide banding to the top and bottom of the case.
- Cut, fit and glue the extra-wide banding to the torsion box's sides and long back edge. You don't band the long front edge until after you install the T-track (see Step 13).

Finish the top

- Use your router to cut the dado for the T-track (V) in the top. Cut the T-track to length, file the sawn edges to remove burrs and screw it in place.
- Cut, fit and glue the final edge banding to the front of the top.
- Round all the edge-banded corners by hand-sanding or using an 1/8" round-over bit.
- Center the router plate on the top and rout the recess for it according to the manufacturer's instructions.

Make the legs

- Prepare the leg material from solid wood. Cut the parts to final length with a 10° angle on the top ends of the box parts (R, S) and the bottom end of the adjustable foot (T).
- Cut the leg tapers (Photo 6).
- Cut the slot in the adjustable foot.
- Install the T-nut in the leg. Glue and clamp the leg boxes together.
- Bolt the adjustable foot to the leg box.

Put it all together

- First, screw the hinges to the legs. Then, with the legs in place, screw the hinges to the bottom of the top (Photo 7).
- Flip the case upside down onto a pair of spacers and install the casters and continuous hinge (Photo 8). The casters we've specified are double locking, so they don't roll or swivel when locked.
- Flip the top and case together, get some help and flip the case and top assembly upright.
- Open the top and level it using the adjustable feet.
- Drill and countersink the table insert and screw it to the opening in the top (Photo 9).
- Screw the hinges to the door, and fasten the door to the case (Photo 10).
- Attach the router table switch and chest handle to the folding top.
- Using the same screws that hold the switch, fasten a bungee cord to the top. This acts as a retainer for one leg when you're folding and unfolding the table. The other leg swings free so it drops into place when you unfold the table.

Make the fence

- Cut all the fence pieces (U, V, W, X, AA, BB) to size. Tip: Make a handful of subfences so you have extras.
- Rout the slots in the fence base and face and cut out the bit clearance notches (Photo 11). Long slots in the base allow the fence to skew on the table as you're making adjustments. Slots in the face allow you to slide the subfences for the adjustable opening in the fence.
- Glue and screw the face to the base and attach the support blocks and dust port (AA, Photo 12).
- Cut the T-track and spacer (BB) to length and screw it into the face.

Finish it

- There's plenty of plywood and hardboard left to make drawers, trays, hooks and racks. Outfit your table to hold all your goodies.
- Most routers can remain fastened to the top when the table is folded, and they'll swing right into the cavity in the case. If your router bumps the back of the cavity, just cut that side out, as in Step 6, to provide clearance.
- Apply a coat of finish to all the wooden parts. It's not a must to seal the hardboard top, but a coat of paste wax will help your material slide across it better.

Cutting List

Part	Material	Quantity	Notes
A	1/4" Oak plywood	2	Ribs
B	1/4" Oak plywood	2	Ribs
C	1/4" Oak plywood	2	Ends
D	1/4" Oak plywood	2	Top and bottom skins
E	1/4" Hardboard	1	Top skin
F	1/4" Oak plywood	2	Torsion box top
G	1/4" Oak plywood	2	Torsion box top
H	1/4" Oak plywood	2	Case ribs
J	1/4" Oak plywood	2	Case ribs
K	1/4" Oak plywood	2	Case skins
L	1/4" Oak plywood	1	Top
M	1/4" Oak plywood	1	Bottom
N	1/4" Oak plywood	2	Door panels
O	1/4" Oak plywood	2	Case edge banding
P	1/4" Oak plywood	2	Top and bottom edge banding
Q	1/4" Oak plywood	2	Torsion box edge banding
R	1/4" Oak plywood	2	Leg tapers
S	1/4" Oak plywood	2	Leg tapers
T	1/4" Oak plywood	1	Adjustable foot
U	1/4" Oak plywood	2	Fence base
V	1/4" Oak plywood	2	Fence face
W	1/4" Oak plywood	2	Fence subfences
X	1/4" Oak plywood	2	Fence subfences
AA	1/4" Oak plywood	2	Support blocks
BB	1/4" Oak plywood	2	T-track and spacer

1. The router table tops a torsion box, which guarantees a

stiff, flat surface. Assemble it with glue and screws, holding the edges flush. Brad-nail the parts first to hold them in place while you drill and drive the screws.

2. Pin the top and bottom skins to the torsion box so they don't shift during clamping. Avoid the T-track locations so you don't rout into a brad later. It only takes a few brads to hold the parts in place.

3. Glue the torsion box on your tablesaw. The surface of the saw virtually guarantees a flat top. Place the hardboard face down on the saw, spread a uniform film of glue on the hardboard and lay the torsion box on it. Weight the sandwich with sandbags.

4. Flush-trim the cavity in the bottom of the torsion box assembly. Use a jigsaw to remove most of the waste first.

5. Assemble the case using glue and screws. Use layout lines to correctly locate the skins on the ribs.

6. Taper the sides of the legs using a taper jig on the tablesaw. The leg sides must be cut to final length before you taper them.

7. Screw the leg hinges to the bottom of the router table top. The legs should bypass each other when they're folded.

8. Attach the top assembly to the case using a continuous hinge. Use a pair of 2-1/4" spacers under the case to make it level with the top.

9. Drill and countersink eight holes through the table insert, and fasten it to the top with flat-head sheet-metal screws. This ensures your router won't tumble out when you fold the table top down.

10. Screw the self-closing hinges to the door and fasten the door to the case. It's easier to drive the screws if you first *** the plywood using a scratch awl.

11. Cut notches in the fence using a jigsaw. After the fence is assembled, the notches provide clearance for router bits.

12. Assemble the fence with glue and screws. Make sure the face and base are dead square to each other.
